

Apex Triggers

Get Started with Apex Triggers

CHALLENGE

Create an Apex trigger

Create an Apex trigger that sets an account's Shipping Postal Code to match the Billing Postal Code if the Match Billing Address option is selected. Fire the trigger before inserting an account or updating an account.

Pre-Work:

Add a checkbox field to the Account object:

1. Field Label: Match Billing Address
2. Field Name: Match_Billing_Address Note: The resulting API Name should be Match_Billing_Address__c.
3. Create an Apex trigger:
4. Name: AccountAddressTrigger
- 5. Object: Account**
 1. Events: before insert and before update
 2. Condition: Match Billing Address is true
 3. Operation: set the Shipping Postal Code to match the Billing Postal Code

AccountAddressTrigger.apxt

```
trigger AccountAddressTrigger on Account (before insert,before update) {  
    for(Account a:Trigger.New){ if(a.Match_Billing_Address__c==true)  
        {  
            a.ShippingPostalCode=a.BillingPostalCode;  
        }  
    }  
}
```

Bulk Apex Triggers

CHALLENGE

Create a Bulk Apex trigger

Create a bulkified Apex trigger that adds a follow-up task to an opportunity if its stage is Closed Won. Fire the Apex trigger after inserting or updating an opportunity.

1. Create an Apex trigger:
2. Name: ClosedOpportunityTrigger
 - Object: **Opportunity**
1. Events: after insert and after update □ Condition: Stage is Closed Won
 - Operation: Create a task:
2. Subject: Follow Up Test Task
3. WhatId: the opportunity ID (associates the task with the opportunity)
4. Bulkify the Apex trigger so that it can insert or update 200 or more opportunities

ClosedOpportunityTrigger.apxt

```
trigger ClosedOpportunityTrigger on Opportunity (after insert,after update) {
    List<Task> tList = new List<Task>(); for(Opportunity
    o:Trigger.new) {
        if(Trigger.isInsert) {
            if(o.StageName == 'Closed Won') {
                tList.add(new Task(Subject = 'Follow Up Test Task', WhatId = o.Id));
            }
        }
        if(Trigger.isUpdate) {
            if(o.StageName == 'Closed Won' && o.StageName !=
Trigger.oldMap.get(o.Id).StageName) { tList.add(new Task(Subject='Follow Up Test
Task',WhatId =o.Id));
            }
        }
    }
}
```

```
}  
if(tList.size()>0) {  
    insert tList;  
} }
```

Apex Testing

Get Started with Apex Unit Tests

CHALLENGE

Create a Unit Test for a Simple Apex Class

Create and install a simple Apex class to test if a date is within a proper range, and if not, returns a date that occurs at the end of the month within the range. You'll copy the code for the class from GitHub. Then write unit tests that achieve 100% code coverage.

1. Create an Apex class:
2. Name: VerifyDate
3. Code: [Copy from GitHub](#)
4. Place the unit tests in a separate test class:
5. Name: TestVerifyDate
6. Goal: 100% code coverage
7. Run your test class at least once

VerifyDate.apxc public class VerifyDate { public static Date

CheckDates(Date date1, Date date2) {

 //if date2 is within the next 30 days of date1, use date2. Otherwise use the
 end of the month

 if(DateWithin30Days(date1,date2)) { return

```

        date2;

    } else {
        return SetEndOfMonthDate(date1);
    }
}

//method to check if date2 is within the next 30 days of date1 private static
Boolean DateWithin30Days(Date date1, Date date2) {

    //check for date2 being in the past if( date2
    < date1) { return false; }

    //check that date2 is within (>=) 30 days of date1

    Date date30Days = date1.addDays(30); //create a date 30 days away from
date1 if( date2 >= date30Days ) { return false; } else { return true; }

}

//method to return the end of the month of a given date private static
Date SetEndOfMonthDate(Date date1) {

    Integer totalDays = Date.daysInMonth(date1.year(), date1.month());

    Date lastDay = Date.newInstance(date1.year(), date1.month(), totalDays);

    return lastDay;

}
}

```

TestVerifyDate.apxc @isTest

```
private class TestVerifyDate {
```

```
@isTest static void
```

```
CheckDatesTesttrue() {
```

```
    Date date1=date.today();
```

```
    Date date2=date1.addDays(29);
```

```
    Date t = VerifyDate.CheckDates(date1, date2);
```

```
    System.assertEquals(t, date2);
```

```
}
```

```
@isTest static void DateOver() {
```

```
    Date date1=date.today();
```

```
    Date date2=date1.addDays(31);
```

```
    Date t = VerifyDate.CheckDates(date1, date2);
```

```
    System.assertNotEquals(t, date1);
```

```
}
```

```
}
```

Test Apex Triggers

CHALLENGE

Create a Unit Test for a Simple Apex Trigger

Create and install a simple Apex trigger which blocks inserts and updates to any contact with a last name of 'INVALIDNAME'. You'll copy the code for the class from GitHub. Then write unit tests that achieve 100% code coverage.

1. Create an Apex trigger on the Contact object
2. Name: RestrictContactByName
3. Code: [Copy from GitHub](#)
4. Place the unit tests in a separate test class
5. Name: TestRestrictContactByName
6. Goal: 100% test coverage
7. Run your test class at least once

RestrictContactByName.apxt trigger RestrictContactByName on Contact

```
(before insert, before update) {
```

```
//check contacts prior to insert or update for invalid data For
```

```
(Contact c : Trigger.New) { if(c.LastName == 'INVALIDNAME') {
```

```
//invalidname is invalid
```

```

c.AddError('The Last Name "'+c.LastName+'" is not allowed for DML');

        }

    }

}

```

TestRestrictContactByName.apxc

```

@isTest public class TestRestrictContactByName
{
    @isTest static void createBadContact(){
        Contact c=new Contact(FirstName='John',LastName='INVALIDNAME');

        Test.startTest();

        Database.SaveResult result=Database.insert(c,false);

        Test.stopTest();

        System.assert(!result.isSuccess());
    }
}

```

Create Test Data for Apex Tests

CHALLENGE

Create a Contact Test Factory

Create an Apex class that returns a list of contacts based on two incoming

parameters: the number of contacts to generate and the last name. Do not insert the generated contact records into the database.

NOTE: For the purposes of verifying this hands-on challenge, don't specify the @isTest annotation for either the class or the method, even though it's usually required.

1. Create an Apex class in the public scope
2. Name: RandomContactFactory (without the @isTest annotation)
3. Use a Public Static Method to consistently generate contacts with unique first names based on the iterated number in the format Test 1, Test 2 and so on.
4. Method Name: generateRandomContacts (without the @isTest annotation)
5. Parameter 1: An integer that controls the number of contacts being generated with unique first names
6. Parameter 2: A string containing the last name of the contacts
7. Return Type: List < Contact >

RandomContactFactory.apxc public class

```
RandomContactFactory {  
  
    public static List<Contact> generateRandomContacts(Integer  
NumberOfContacts, String name){  
        List<Contact> con = new List<Contact>(); for(Integer  
  
        i=0; i<NumberOfContacts; i++){ name = 'Test'+i;  
  
        Contact c = new Contact(FirstName=name, LastName=name);  
  
        con.add(c);  
  
    }  
  
    return con;  
  
}
```

}

Asynchronous Apex

Use Batch Apex

CHALLENGE

Create an Apex class that uses Batch Apex to update Lead records. Create an Apex class that implements the Database.Batchable interface to update all Lead records in the org with a specific LeadSource.

1. Create an Apex class:
2. Name: LeadProcessor
3. Interface: Database.Batchable
4. Use a QueryLocator in the start method to collect all Lead records in the org
5. The execute method must update all Lead records in the org with the LeadSource value of Dreamforce □ Create an Apex test class:
6. Name: LeadProcessorTest
7. In the test class, insert 200 Lead records, execute the LeadProcessor Batch class and test that all Lead records were updated correctly
8. The unit tests must cover all lines of code included in the **LeadProcessor** class, resulting in 100% code coverage
9. Before verifying this challenge, run your test class at least once using the Developer Console Run All feature

LeadProcessor.apxc

```
public class LeadProcessor implements Database.Batchable<SObject>,  
Database.Stateful{ public Integer recordProcessed = 0; public  
  
    Database.QueryLocator start(Database.BatchableContext bc) { return
```

```

Database.getQueryLocator([Select LeadSource From Lead ]);

}

public void execute(Database.BatchableContext bc, List<Lead> scope) { for

    (Lead lead : scope) { lead.LeadSource = 'Dreamforce';

    }

    update scope;

}

public void finish(Database.BatchableContext bc){

}

}

```

LeadProcessorTest.apxc

```

@isTest public class LeadProcessorTest

{

    @isTest
    static void test(){

        List<Lead> leads = new List<Lead>(); for

        (Integer i = 0; i < 200; i++) { Lead lead = new

        Lead(); lead.FirstName = 'testF';

        lead.LastName = 'testL' + i; lead.Company =

        'testCompany' + i; leads.add(lead);

        }

        insert leads;
    }
}

```

```

Test.startTest();

LeadProcessor leadProcessor = new LeadProcessor();

Database.executeBatch(leadProcessor);

Test.stopTest();

System.assertEquals(200, [select count() from Lead where LeadSource =
'Dreamforce' ]);

}

}

```

Control Processes with Queueable Apex

CHALLENGE

Create a Queueable Apex class that inserts Contacts for Accounts. Create a Queueable Apex class that inserts the same Contact for each Account for a specific state.

1. Create an Apex class:
2. Name: AddPrimaryContact
3. Interface: Queueable
4. Create a constructor for the class that accepts as its first argument a Contact sObject and a second argument as a string for the State abbreviation
5. The execute method must query for a maximum of 200 Accounts with the BillingState specified by the State abbreviation passed into the constructor and insert the Contact sObject record associated to each Account. Look at the sObject clone() method. □ Create an Apex test class:
6. Name: AddPrimaryContactTest
7. In the test class, insert 50 Account records for BillingState NY and 50 Account records for BillingState CA
8. Create an instance of the AddPrimaryContact class, enqueue the job,

and assert that a Contact record was inserted for each of the 50 Accounts with

the BillingState of CA

9. The unit tests must cover all lines of code included in the **AddPrimaryContact** class, resulting in 100% code coverage
10. Before verifying this challenge, run your test class at least once using the Developer Console Run All feature

```
AddPrimaryContact.apxc public class AddPrimaryContact
implements Queueable { private Contact contact; private String
state; public AddPrimaryContact(Contact contact, String state){
this.contact = contact; this.state = state;
}

public void execute(QueueableContext context){
    List<Account> accounts = [select ID, Name, (select id, FirstName, LastName from
contacts) from Account where BillingState = :state limit 200 ]; List<Contact> contacts =
new List<Contact>(); for (Account account : accounts) {

        Contact temp = contact.clone(false, false, false, false);

        temp.AccountId = account.Id; contacts.add(temp);

    }

    if (contacts.size() > 0) { insert
        contacts;
    }
}
```

```
}
```

AddPrimaryContactTest.apxc

```
@isTest public class AddPrimaryContactTest
{
    @testSetup static void
    setup(){
        List<Account> accounts = new List<Account>(); for (Integer i = 0; i <
        50; i++) { accounts.add(new Account(Name='NY'+i, billingstate='NY'));
        }
        for (Integer i = 0; i < 50; i++) { accounts.add(new
            Account(Name='CA'+i, billingstate='CA'));
        }
        insert accounts;
    }

    static testmethod void testQueueable(){
        Contact contact = new Contact(FirstName = 'AddPrimaryContactTest', LastName =
        'Queueable');

        Test.startTest();

        AddPrimaryContact addPrimaryContact = new AddPrimaryContact(contact,
        'CA');

        System.enqueueJob(addPrimaryContact);

        Test.stopTest();

        System.assertEquals(50, [select count() from Contact where AccountId in
```

```
(select Id from Account where BillingState = 'CA'))];  
  
    }  
  
}
```

Schedule Jobs Using the Apex Scheduler

CHALLENGE

Create an Apex class that uses Scheduled Apex to update Lead records.

Create an Apex class that implements the Schedulable interface to update Lead records with a specific LeadSource. (This is very similar to what you did for Batch Apex.)

1. Create an Apex class:
2. Name: DailyLeadProcessor
3. Interface: Schedulable
4. The execute method must find the first 200 Lead records with a blank LeadSource field and update them with the LeadSource value of Dreamforce □ Create an Apex test class:
5. Name: DailyLeadProcessorTest
6. In the test class, insert 200 Lead records, schedule the DailyLeadProcessor class to run and test that all Lead records were updated correctly
7. The unit tests must cover all lines of code included in the **DailyLeadProcessor** class, resulting in 100% code coverage.
8. Before verifying this challenge, run your test class at least once using the Developer Console Run All feature

DailyLeadProcessor.apxc public class DailyLeadProcessor

implements Schedulable { public void

```

execute(SchedulableContext context){

    List<Lead> leads = [select Id, LeadSource from Lead where LeadSource = null];

    for (Lead lead : leads) { lead.LeadSource =

        'Dreamforce';

    }

    update leads;

}
}

```

DailyLeadProcessorTest.apxc

```

@isTest
public class DailyLeadProcessorTest {
    static @IsTest void
    testScheduledJob(){
        List<Lead> leads = new List<Lead>(); for
        (Integer i = 0; i < 200; i++) {
            leads.add(new Lead(LastName = 'Dreamforce'+i, Company = 'test'+i));
        }
        insert leads;

        Map<Id,Lead> leadMap = new Map<Id,Lead>(leads);
        List<Id> leadsId = new List<Id>(leadMap.keySet());
        Test.startTest();
        System.schedule('DailyLeadProcessor', '20 30 8 10 2 ?', new
        DailyLeadProcessor());
        Test.stopTest();
        System.assertEquals(200, [select count() from Lead where LeadSource =
        'Dreamforce' and Id in :leadsId]);
    }
}

```

```
}
```

Apex Integration Services

Apex REST Callouts

CHALLENGE

Create an Apex class that calls a REST endpoint and write a test class. Create an Apex class that calls a REST endpoint to return the name of an animal, write unit tests that achieve 100% code coverage for the class using a mock response, and run your Apex tests.

Prework: Be sure the Remote Sites from the first unit are set up.

1. Create an Apex class:
2. Name: AnimalLocator
3. Method name: getAnimalNameById
4. The method must accept an Integer and return a String.
5. The method must call `https://th-apex-httpcallout.herokuapp.com/animals/<id>`, replacing `<id>` with the ID passed into the method
6. The method returns the value of the **name** property (i.e., the animal name) □ Create a test class:
7. Name: AnimalLocatorTest
8. The test class uses a mock class called AnimalLocatorMock to mock

the callout response

9. Create unit tests:

10. Unit tests must cover all lines of code included in the **AnimalLocator** class, resulting in 100% code coverage

11. Run your test class at least once (via **Run All** tests the Developer Console) before attempting to verify this challenge

AnimalLocator.apxc public class

AnimalLocator

{

public static String getAnimalNameById(Integer id)

{

Http http = new Http();

HttpRequest request = new HttpRequest(); request.setEndpoint('https://th-apex-http-callout.herokuapp.com/animals/'+id); request.setMethod('GET');

HttpResponse response = http.send(request);
String strResp = ""; system.debug('*****response

' + response.getStatusCode()); system.debug('*****response

' + response.getBody());

// If the request is successful, parse the JSON response. if

(response.getStatusCode() == 200)

{

// Deserializes the JSON string into collections of primitive data types.

Map<String, Object> results = (Map<String, Object>)

```

JSON.deserializeUntyped(response.getBody());

    // Cast the values in the 'animals' key as a list

    Map<string,object> animals = (map<string,object>) results.get('animal');

    System.debug('Received the following animals:' + animals ); strResp =

    string.valueOf(animals.get('name'));

    System.debug('strResp >>>>>' + strResp );

}

return strResp ;

}

}

```

AnimalLocatorTest.apxc

```

@isTest
private class AnimalLocatorTest{
    @isTest static void AnimalLocatorMock1() {
        Test.SetMock(HttpCallOutMock.class, new AnimalLocatorMock()); string
        result=AnimalLocator.getAnimalNameById(3); string
        expectedResult='chicken';
        System.assertEquals(result, expectedResult);
    }
}

```

Apex SOAP Callouts

CHALLENGE

Generate an Apex class using WSDL2Apex and write a test class. Generate an Apex class using WSDL2Apex for a SOAP web service, write unit tests that achieve 100% code coverage for the class using a mock response, and run your Apex tests.

Prework: Be sure the Remote Sites from the first unit are set up.

1. Generate a class using this using [thisWSDLfile](#):
2. Name: ParkService (Tip: After you click the **Parse WSDL** button, change the Apex class name from **parksServices** to ParkService)
3. Class must be in public scope ☐ Create a class:
4. Name: ParkLocator
5. Class must have a **country** method that uses the **ParkService** class
6. Method must return an array of available park names for a particular country passed to the web service (such as Germany, India, Japan, and United States)
7. Create a test class:
8. Name: ParkLocatorTest
9. Test class uses a mock class called ParkServiceMock to mock the callout response

☐

Create unit tests:

☐

10. Unit tests must cover all lines of code included in the **ParkLocator** class, resulting in 100% code coverage.
11. Run your test class at least once (via **Run All** tests the Developer Console) before attempting to verify this challenge.

ParkLocator.apxc

```
public class ParkLocator {  
    public static String[] country(String country){  
        ParkService.ParksImplPort parks = new ParkService.ParksImplPort();  
        String[] parksname = parks.byCountry(country); return  
        parksname;  
    }  
}
```

ParkLocatorTest.apxc

```
@isTest
private class ParkLocatorTest{
    @isTest
    static void testParkLocator() {
        Test.setMock(WebServiceMock.class, new ParkServiceMock());
        String[] arrayOfParks = ParkLocator.country('India');

        System.assertEquals('Park1', arrayOfParks[0]);
    }
}
```

ParkService.apxc

```
public class ParkService {
    public class byCountryResponse {
        public String[] return_x;
        private String[] return_x_type_info = new
String[]{'return','http://parks.services/',null,'0','-1','false'}; private
        String[] apex_schema_type_info = new
String[]{'http://parks.services/','false','false'}; private String[]
        field_order_type_info = new String[]{'return_x'};
    }
    public class byCountry {
        public String arg0;
        private String[] arg0_type_info = new
String[]{'arg0','http://parks.services/',null,'0','1','false'}; private
        String[] apex_schema_type_info = new
String[]{'http://parks.services/','false','false'}; private String[]
        field_order_type_info = new String[]{'arg0'};
    }
    public class ParksImplPort {
        public String endpoint_x = 'https://th-apex-soap-
service.herokuapp.com/service/parks'; public

'ParkService'}; public String[] byCountry(String
        arg0) {
            ParkService.byCountry request_x = new ParkService.byCountry(); request_x.arg0 =
            arg0;
```

```

        ParkService.byCountryResponse response_x;
        Map<String, ParkService.byCountryResponse> response_map_x = new
Map<String, ParkService.byCountryResponse>(); response_map_x.put('response_x',
        response_x);
        WebServiceCallout.invoke( this,
        request_x, response_map_x,
        new String[] {endpoint_x,
        "",
        'http://parks.services/',
        'byCountry',
        'http://parks.services/',
        'byCountryResponse',
        'ParkService.byCountryResponse'}
        );
        response_x = response_map_x.get('response_x'); return
        response_x.return_x;
    }
}
}

```

ParkServiceMock.apxc

@isTest global class ParkServiceMock implements WebServiceMock

```

{ global void doInvoke(

    Object stub,
    Object request,

    Map<String, Object> response,

    String endpoint,

    String soapAction,

    String requestName,

    String responseNS,

    String responseName,

```

```

String responseType) {

    ParkService.byCountryResponse response_x = new
ParkService.byCountryResponse();

    List<String> lstofDummyParks = new List<String> {'Park1','Park2','Park3'};

    response_x.return_x = lstofDummyParks;

    response.put('response_x', response_x);

}
}

```

Apex Web Services

CHALLENGE

Create an Apex REST service that returns an account and its contacts.

Create an Apex REST class that is accessible at `/Accounts/<Account_ID>/contacts`. The service will return the account's ID and name plus the ID and name of all contacts associated with the account. Write unit tests that achieve 100% code coverage for the class and run your Apex tests.

Prework: Be sure the Remote Sites from the first unit are set up.

1. Create an Apex class
2. Name: AccountManager
3. Class must have a method called getAccount
4. Method must be annotated with **@HttpGet** and return an **Account** object
5. Method must return the **ID** and **Name** for the requested record and all associated contacts with their **ID** and **Name**

6. Create unit tests
7. Unit tests must be in a separate Apex class called `AccountManagerTest`
8. Unit tests must cover all lines of code included in the **`AccountManager`** class, resulting in 100% code coverage
9. Run your test class at least once (via **Run All** tests the Developer Console) before attempting to verify this challenge

AccountManager.apxc

```
@RestResource(urlMapping='/Accounts/*/contacts') global with
sharing class AccountManager{

    @HttpGet global static Account
    getAccount(){

        RestRequest req = RestContext.request;

        String accId = req.requestURI.substringBetween('Accounts/', '/contacts');

        Account acc = [SELECT Id, Name, (SELECT Id, Name FROM Contacts)

            FROM Account WHERE Id = :accId];

        return acc;

    }
}
```

AccountManagerTest.apxc

```
@IsTest private class
AccountManagerTest{

    @isTest static void testAccountManager(){

        Id recordId = getTestAccountId();
```

```

// Set up a test request

RestRequest request = new RestRequest(); request.requestUri =

        'https://ap5.salesforce.com/services/apexrest/Accounts/'+ recordId
+ '/contacts'; request.httpMethod =

    'GET';

RestContext.request = request;

// Call the method to test

Account acc = AccountManager.getAccount();

// Verify results

System.assert(acc != null);
}

private static Id getTestAccountId(){

    Account acc = new Account(Name = 'TestAcc2');

    Insert acc;
    Contact con = new Contact(LastName = 'TestCont2', AccountId = acc.Id); Insert con;

    return acc.Id;

}
}

```

Apex Specialist Superbadge

Automate record creation

Install the unlocked package and configure the development org. Use the included package content to automatically create a Routine Maintenance request every time a maintenance request of type Repair or Routine Maintenance is updated to Closed. Follow the specifications and naming conventions outlined in the business requirements.

MaintenanceRequest.apxt trigger MaintenanceRequest on Case (before

```
update, after update) { if (Trigger.isUpdate && Trigger.isAfter){  
  
    MaintenanceRequestHelper.updateWorkOrders(Trigger.New, Trigger.OldMap);  
  
}  
}
```

MaintenanceRequestHelper.apxc

```
public with sharing class MaintenanceRequestHelper {  
    public static void updateWorkOrders(List<Case> updWorkOrders, Map<Id,Case>  
    nonUpdCaseMap) {  
        Set<Id> validIds = new Set<Id>();

            wpClone.Maintenance_Request__c = nc.Id; ClonedWPs.add(wpClone);

        }
    }
    insert ClonedWPs;
}
}

```

```
}
```

Synchronize Salesforce data with an external system

Implement an Apex class (called `WarehouseCalloutService`) that implements the `Queueable` interface and makes a callout to the external service used for warehouse inventory management. This service receives updated values in the external system and updates the related records in Salesforce. Before checking this section, enqueue the job at least once to confirm that it's working as expected.

`WarehouseCalloutService.apxc`

```
public with sharing class WarehouseCalloutService implements Queueable {
    private static final String WAREHOUSE_URL = 'https://th-superbadge-
apex.herokuapp.com/equipment'; @future(callout=true)
    public static void runWarehouseEquipmentSync(){
        System.debug('go into runWarehouseEquipmentSync');
        Http http = new Http();
        HttpRequest request = new HttpRequest();

        request.setEndpoint(WAREHOUSE_URL); request.setMethod('GET');
        HttpResponse response = http.send(request);

        List<Product2> product2List = new List<Product2>();
        System.debug(response.getStatusCode()); if
        (response.getStatusCode() == 200){
            List<Object> jsonResponse =
(List<Object>)JSON.deserializeUntyped(response.getBody());
            System.debug(response.getBody()); for
            (Object jR : jsonResponse){
                Map<String,Object> mapJson = (Map<String,Object>)jR;
                Product2 product2 = new Product2(); //replacement part
                (always true),
                product2.Replacement_Part__c = (Boolean) mapJson.get('replacement');
                //cost
                product2.Cost__c = (Integer) mapJson.get('cost');
                //current inventory
                product2.Current_Inventory__c = (Double) mapJson.get('quantity');
                //lifespan
                product2.Lifespan_Months__c = (Integer) mapJson.get('lifespan');
```

```

        //maintenance cycle
        product2.Maintenance_Cycle__c = (Integer)
mapJson.get('maintenanceperiod'); //warehouse SKU
        product2.Warehouse_SKU__c = (String) mapJson.get('sku');

        product2.Name = (String) mapJson.get('name'); product2.ProductCode =
        (String) mapJson.get('_id'); product2List.add(product2);
    }

    if (product2List.size() >=1){
        upsert product2List;
        System.debug('Your equipment was synced with the warehouse one');
    }
}
}

public static void execute (QueueableContext context){ System.debug('start
runWarehouseEquipmentSync'); runWarehouseEquipmentSync();
System.debug('end runWarehouseEquipmentSync');
}
}

```

Schedule synchronization

Build scheduling logic that executes your callout and runs your code daily. The name of the schedulable class should be WarehouseSyncSchedule, and the scheduled job should be named WarehouseSyncScheduleJob.

WarehouseSyncSchedule.apxc

```

global with sharing class WarehouseSyncSchedule implements Schedulable{
    global void execute(SchedulableContext ctx){
        System.enqueueJob(new WarehouseCalloutService());
    }
}

```

Test automation logic

Build tests for all cases (positive, negative, and bulk) specified in the business requirements by using a class named MaintenanceRequestHelperTest. You must have 100% test coverage to pass this section and assert values to prove

that your logic is working as expected. Choose Run All Tests in the Developer Console at least once before attempting to submit this section. Be patient as it may take 10-20 seconds to process the challenge check.

    }
}

```

Test scheduling logic

Build unit tests for the class WarehouseSyncSchedule in a class named WarehouseSyncScheduleTest. You must have 100% test coverage to pass this challenge and assert values to prove that your logic is working as expected.

WarehouseSyncSchedule.apxc

```

global with sharing class WarehouseSyncSchedule implements Schedulable{
    global void execute(SchedulableContext ctx){

```

```

        System.enqueueJob(new WarehouseCalloutService());
    }
}
WarehouseSyncScheduleTest.apxc
@isTest

public class WarehouseSyncScheduleTest {
    @isTest static void WarehousescheduleTest(){
        String scheduleTime = '00 00 01 * * ?';
        Test.startTest();
        Test.setMock(HttpCalloutMock.class, new WarehouseCalloutServiceMock()); String
        jobID=System.schedule('Warehouse Time To Schedule to Test',
        scheduleTime, new WarehouseSyncSchedule());
        Test.stopTest();
        //Contains schedule information for a scheduled job. CronTrigger is similar to a cron job on
        UNIX systems.
        // This object is available in API version 17.0 and later.
        CronTrigger a=[SELECT Id FROM CronTrigger where NextFireTime > today];
        System.assertEquals(jobID, a.Id, 'Schedule ');

    }
}

```

Lightning Web Components Basics

Deploy Lightning Web Component Files

CHALLENGE

Create an app page for the bike card component

Deploy your files to your Trailhead Playground or Developer Edition org and then use Lightning App Builder to create an app page.

Prework: If you haven't already completed the activities in the What You Need section of this unit, do that now, or this challenge won't pass. Make sure that both Dev Hub and My Domain are enabled in your org and that the org is authorized with Visual Studio Code.

1. Create an SFDX project in Visual Studio Code:
2. Template: **Standard**
3. Project name: bikeCard
4. Add a Lightning Web Component to the project:
5. Folder: **lwc**
6. Component name: bikeCard
7. Copy the content for the component files from this unit into your files in Visual Studio Code:
8. bikeCard.html
9. bikeCard.js
10. bikeCard.js-meta.xml
11. Deploy the bikeCard component files to your org □ Create a Lightning app page:
12. Label: Bike Card
13. Developer Name: Bike_Card
14. Add your bikeCard component to the page □ Activate the page for all users

bikeCard.html <template>

```

<div>
  <div>Name: {name}</div>
  <div>Description: {description}</div>
  <lightning-badge label={material}></lightning-badge>
  <div>Price: {price}</div>
  <div><img src={pictureUrl}/></div>
</div> </template> bikeCard.js

```

```

import { LightningElement } from 'lwc';
export default class BikeCard extends LightningElement {
  name = 'Electra X4';
  description = 'A sweet bike built for comfort.';
  category = 'Mountain'; material = 'Steel';
  price = '$2,700';
  pictureUrl = 'https://s3-us-west-1.amazonaws.com/sfdc-
demo/ebikes/electrax4.jpg';
}

```

bikeCard.js-meta.xml

```

<?xml version="1.0" encoding="UTF-8"?>
<LightningComponentBundle xmlns="http://soap.sforce.com/2006/04/metadata">
  <!-- The apiVersion may need to be increased for the current release -->
  <apiVersion>52.0</apiVersion>
  <isExposed>true</isExposed>
  <masterLabel>Product Card</masterLabel>
  <targets>
    <target>lightning__AppPage</target>
    <target>lightning__RecordPage</target>
    <target>lightning__HomePage</target>
  </targets>
</LightningComponentBundle>

```

Add Styles and Data to a Lightning Web Component

CHALLENGE

Import the current user's name into your Lightning app page Create a Lightning app page that uses the wire service to display the current user's name.

Pework: You need files created in the previous unit to complete this challenge. If you haven't already completed the activities in the previous unit, do that now.

1. Create a Lightning app page:
2. Label: Your Bike Selection □ Developer Name: Your_Bike_Selection □
Add the current user's name to the app container:
3. Edit selector.js
4. Edit selector.html

```
Selector.js (after editing the given code) import { LightningElement,  
  
wire } from 'lwc'; import { getRecord, getFieldValue } from  
  
'lightning/uiRecordApi'; import Id from '@salesforce/user/Id'; import  
  
NAME_FIELD from '@salesforce/schema/User.Name'; const fields =  
  
[NAME_FIELD]; export default class Selector extends LightningElement {  
  
selectedProductId; handleProductSelected(evt) { this.selectedProductId
